## **Instructions to Voters/Comments on API 520 Part I Ballot – “Kp for Sub-cooled Liquid in Annex B and C” 1st Ballot**

- This is the 1st Ballot for this work item. It covers AI 2019-22 and updates Annex B and C to include the Kp factor in the two-phase sizing procedure for sub-cooled liquid where the PRV is not certified for liquid.
- This ballot only includes the changes that occurred when resolving the comments from the 2nd Ballot.
- Your comments should be limited to the **red-lines portions of the ballot only.**
- Don't worry about formatting issues, particularly with the equations since these are a mess. These will be fixed during final editing.
- If you are voting negative, please indicate which of your comment or comments are the reason for your negative vote. API's Balloting system will categorize all of your comments as Negative.

Thanks to Casey Houston and his work group for their efforts.

Phil Henry  
API 520 Task Force Chair

## Annex B (informative)

### Review of Flow Equations Used in Sizing Pressure-relief Devices

#### B.1 Development of Flow Equations

##### B.1.1 General

##### B.1.2 General Applicability

##### B.1.3 Numerical Integration Example

##### B.1.4 Capacity Corrections

**B.1.4.1** Once the theoretical mass flux through the nozzle has been determined, various correction factors are employed to derive an expression for the PRV rated capacity corrected for the actual overpressure. These correction factors may include coefficients of discharge ( $K_d$ ), backpressure correction factors ( $K_b$  and  $K_w$ ), viscosity correction factors ( $K_v$ ), overpressure correction factors ( $K_p$ ), and combination capacity correction factors ( $K_c$ ) depending on the applicability of those correction factors. A general expression for the PRV sizing equation is shown in Equation (B.5).

$$W = GAII[K] \tag{B.5}$$

where

- $G$  is the theoretical mass flux through the nozzle, lb/s•ft<sup>2</sup> (kg/s•m<sup>2</sup>);
- $W$  is the mass flow through the PRV, lb/s (kg/s);
- $A$  is the discharge area of the PRV, ft<sup>2</sup> (m<sup>2</sup>);
- $II[K]$  is the product of all applicable correction factors (no units).

**\*\*Remainder of Annex B remains unchanged\*\***

## Annex C (informative)

### Sizing for Two-phase Liquid/Vapor Relief

#### C.1 Sizing for Two-phase Liquid/Vapor Relief

#### C.2 Sizing Methods

##### C.2.1 Sizing by Direct Integration of the Isentropic Nozzle Flow

###### C.2.1.1 General

Paragraphs 2.1.1.1 through 2.1.1.6 remains unchanged

###### C.2.1.2 Pressure Relief Valves Requiring Capacity Certification

Once the value for the mass flux has been determined, the required orifice area can be calculated using Equation (C.9) or Equation (C.10).

In USC units:

$$A = \frac{0.04W}{K_d K_b K_c K_v G} \quad (\text{C.9})$$

In SI units:

$$A = \frac{277.8W}{K_d K_b K_c K_v G} \quad (\text{C.10})$$

where

$A$  is the required discharge area, in.<sup>2</sup> (mm<sup>2</sup>);

$W$  is the required mass flow rate, lb/h (kg/h);

$K_d$  is the coefficient of discharge; for a preliminary sizing estimation, an effective coefficient of discharge of 0.85 can be used for a two-phase mixture or saturated liquid entering the PRV inlet. For the case of a subcooled liquid entering the PRV inlet, a coefficient of discharge equal to 0.65 is consistent with the single-phase method in Equation (33) and Equation (34). Note that a value of 0.65 may result in a conservative valve size for liquids that are only slightly subcooled; the user may select other methods for determining a coefficient of discharge<sup>[8, 9, 10]</sup>;

$K_b$  is the backpressure correction factor for vapor that should be obtained from the valve manufacturer; for a preliminary sizing estimation, use Figure 31. The backpressure correction factor applies to balanced-bellows valves only;

$K_c$  is the combination correction factor for installations with a rupture disk upstream of the PRV (see 5.12.2);

This document is not an API Standard; it is under consideration within an API technical committee but has not received all approvals required to become an API Standard. It shall not be reproduced or circulated or quoted, in whole or in part, outside of API committee activities except with the approval of the Chairman of the committee having jurisdiction and staff of the API Standards Dept. Copyright API. All rights reserved.

- the combination correction factor is 1.0, when a rupture disk is not installed;
- the combination correction factor is 0.9, when a rupture disk is installed in combination with a PRV and the combination does not have a certified value;

$K_v$  is the viscosity correction factor; for two-phase flows where the liquid has a viscosity of 100 cP (0.1 Pa-s) or less, the viscosity correction factor can be set to 1.0;

$G$  is the mass flux, lb/s·ft<sup>2</sup> (kg/s·m<sup>2</sup>).

### C.2.1.3 Example

#### C.2.1.4 Pressure Relief Valves not Requiring Capacity Certification

Equation (C.9) and Equation (C.10) are modified as shown in Equation (C.xx) and Equation (C.yy) to handle liquid service PRVs that have never been certified (see 5.9 for a discussion on noncertified PRVs):

In USC units:

$$A = \frac{0.04 \times W}{K_d K_b K_c K_v G} \times \frac{\sqrt{P_1 - P_2}}{K_p \sqrt{1.25 \times P_s - P_2}} \quad \text{(C.xx)}$$

In SI units:

$$A = \frac{277.8 \times W}{K_d K_b K_c K_v G} \times \frac{\sqrt{P_1 - P_2}}{K_p \sqrt{1.25 \times P_s - P_2}} \quad \text{(C.yy)}$$

where

$A$  is the required discharge area, in.<sup>2</sup> (mm<sup>2</sup>);

$W$  is the required mass flow rate, lb/h (kg/h);

$K_d$  is the coefficient of discharge and shall be 0.62;

$K_b$  is the backpressure correction factor;

$K_c$  is the combination correction factor;

$K_v$  is the viscosity correction factor;

$K_p$  is the correction factor due to overpressure; at 25% overpressure,  $K_p = 1.0$ . For overpressures other than 25%,  $K_p$  is determined from Figure 39;

$P_s$  is the set pressure, psig (Pag);

$P_l$  is the upstream relieving pressure, psig (Pag); this is the set pressure plus allowable overpressure;

$P_2$  is the total backpressure, psig (Pag).

This document is not an API Standard; it is under consideration within an API technical committee but has not received all approvals required to become an API Standard. It shall not be reproduced or circulated or quoted, in whole or in part, outside of API committee activities except with the approval of the Chairman of the committee having jurisdiction and staff of the API Standards Dept. ## C.2.2 Sizing for Subcooled Liquid at the Pressure-relief Valve Inlet Using the Omega Method

**Section C.2.2 remains unchanged**

## C.2.3 Sizing for Subcooled Liquid at the Pressure-relief Valve Inlet Using the Omega Method

### C.2.3.1 Pressure-relief Valves Requiring Capacity Certification

### C.2.3.2 Example

### C.2.3.3 Pressure-relief Valves Not Requiring Capacity Certification

~~If the PRV is one that was never certified in liquid service (see 5.9 for a discussion on noncertified PRVs), then the area calculated using Equation (C.45) or Equation (C.46) needs to be adjusted to account for the higher overpressures required to get the valve to go to full lift. Equation (C.45) and Equation (C.46) are modified as shown in Equation (C.56) and Equation (C.57) to handle liquid service PRVs that have never been certified (see 5.9 for a discussion on noncertified PRVs):~~

In USC units:

$$A = 0.3208 \frac{Q \rho_{l1}}{K_d K_b K_c K_v G} \times \frac{\sqrt{P_1 - P_2}}{K_p \sqrt{1.25 P_s - P_2}} \quad (\text{C.56})$$

In SI units:

$$A = 16.67 \frac{Q \rho_{l1}}{K_d K_b K_c K_v G} \times \frac{\sqrt{P_1 - P_2}}{K_p \sqrt{1.25 P_s - P_2}} \quad (\text{C.57})$$

where

$A$  is the required effective discharge area, in.<sup>2</sup> (mm<sup>2</sup>);

$Q$  is the volumetric flow rate, gal/min (L/min);

$\rho_{l1}$  is liquid density at the PRV inlet, lb/ft<sup>3</sup> (kg/m<sup>3</sup>);

$K_d$  is the effective coefficient of discharge and shall be 0.62;

$K_b$  is the backpressure correction factor;  $K_c$  is the combination correction factor;  $K_v$  is the viscosity correction factor;

$K_p$  is the correction factor due to overpressure; at 25 % overpressure,  $K_p = 1.0$ . For overpressures other than 25 %,  $K_p$  is determined from Figure 39;

$P_s$  is the set pressure, psig (Pag);

$P_1$  is the upstream relieving pressure, psig (Pag); this is the set pressure plus allowable overpressure;

$P_2$  is the total backpressure, psig (Pag).
